

Frontmatter & Variables

A YAML-style block between two `---` lines at the very top of the document defines flat key: value metadata - no nested structure, just plain pairs like the six above this paragraph. Every key becomes usable two ways: on the exported PDF's title page, and anywhere in the body text via `{{ key }}`.

Five keys get special title-page treatment

If present, MD Visor uses these automatically, always in this order, regardless of the order they're written in:

Key	What it controls
Title	The title page's headline, and the title repeated in the running header on every page. Missing? Falls back to the document's first # heading, then "Untitled Document".
Project	A line on the title page
Author	A line on the title page
Revision	A line on the title page
Date	A line on the title page

This document's own title page (page 1) was built entirely from its frontmatter - nothing about it is hardcoded.

Any other key still works

Department above isn't one of the five recognized names, but it's not ignored: it still shows up on the title page (below the recognized fields), and it still works for interpolation, exactly like the recognized ones. Add whatever custom fields your document needs - Reviewer, Status, PartNumber, anything.

Using `{{ }}` in text

Reference any key, anywhere in the body, with `{{ KeyName }}`. Matching is case-insensitive, so `Documentation Team` and `Documentation Team` resolve to the same value:

This document was written by Documentation Team (Technical Publications) for the MD Visor Examples project,
revision 1.2, dated 2026-08-13.

A typo'd or undefined name is left exactly as written instead of silently vanishing, so a mistake is obvious rather than hidden - `{{ Reviewer }}` isn't defined in this document's frontmatter, and stays visible as-is right here.
